Interceptor Wash Bay

Designed to be used in conjunction with the jetter bowser, the original specification has been modified and redesigned with an enclosed wash bay which effectively allows you to clean site equipment safe in the knowledge that as the dirty water is draining away, any oil or fuel residue is being contained in the reservoir tray.

Its versatility means you can safely wash a huge variety of equipment without the worry of fuel leaking into the ground or drainage system. Smaller equipment is placed directly into the wash bay whilst larger

units can be positioned via a ramp entry system or an alternative lifting method. Once the washing process is complete, you can be assured that the filtered water will have drained away, leaving the dirt, fuel, oil and grease securely in the reservoir for easy removal.

Key Features:

- Interceptor drip tray
- Removable steel platforms (ambideck)
- Integral oil interceptor
- Lifting/lashing points (x4)
- Site level gauge (oil level indicator) & protector
- Rain water overflow system
- Integrated sides (3 x side any configuration)
